This model illustrates the implementation of a simulation program written in Ptolemy and a controller written in Simulink. The simulation program computes a room's temperature change.

Input to the room model is the control signal u_k . Output of the room model is the new room temperature T_{k+1} . The control action is computed in Simulink. Output of Simulink is the control action and the room temperature setpoint. The room temperature setpoint is used for visualization only.

Output simulation time and wall clock time.
This is for illustration purposes only and not needed by the above model.
